

Trying to understand the different advantages and disadvantages of the electronic world we seek to present the progress of the conceptual design of our project. Understanding needs and requirements, and now some proposals for the graphic interface and the structure of the web services.

I. Web GUI Mockups.

Color Palette:

We looked for a color palette that combines professionalism and visual comfort. Thinking that these chosen colors will guarantee a pleasant user experience, while complying with accessibility standards for visually impaired people.

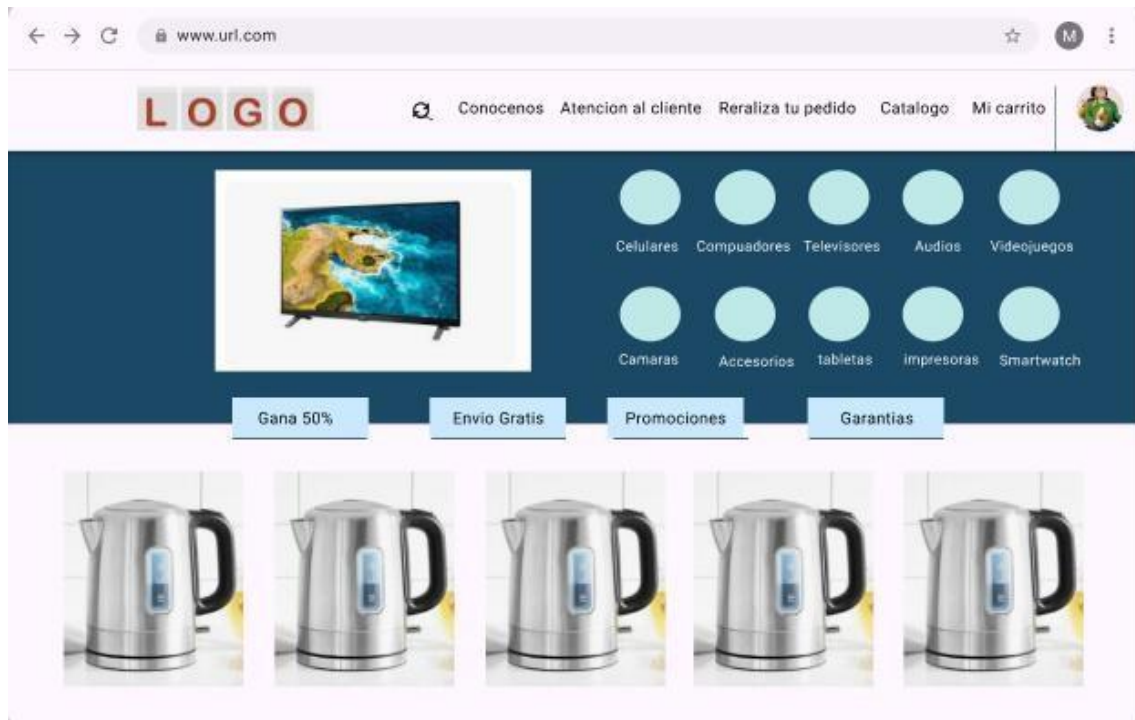

BEE9E8, 62B6CB, 1B4965, CAE9FF, 5FA8D3, Along with white (fff) and black (000).

Mockups:

We pose these the initial sketches of the graphical interface:

- Main page view: This view shows the home page of the platform, where users can browse the featured products and access the different sections of the site.

-Shopping cart view: In this view, users can review the products they have added to the shopping cart.

Questions to the Client:

- Is a visual-attractive design preferred over a functional design (Modify the structure of the mockups)?
- Are there any colors or styles that you would prefer we avoid? (Modify color palette based on responses)
- Would we have payment classification available by customer type?
- Is there any additional functionality to consider?

II. Web Services.

We break down each service available to the customer by organizing it as follows:

User Authentication:

- Name: AuthUser
- Endpoint: /api/auth
- HTTP Method: POST
- Inputs:
 - └ username
 - └ password
- Outputs:
 - └ token
 - └ userID (unique identifier)

New User Registration:

- Name: RegisterUser
- Endpoint: /api/register
- HTTP Method: POST
- Inputs:
 - └ username
 - └ password
 - └ email
 - └ phone
 - └ Address
- Outputs:
 - └ status (success or failure)
 - └ userID (unique identifier)

Getting Products

- Name: getProducts
- Endpoint: /api/products
- HTTP Method: GET
- Inputs:
 - └ category
- Outputs:
 - └ products

Add Products to Cart

- Name: addToCart
- Endpoint: /api/cart
- HTTP Method: POST
- Inputs:
 - └ userID (unique identifier)
 - └ productID (unique identifier)
 - └ quantity
- Outputs:
 - └ Status (success or failure)
 - └ cartID (unique identifier)

With this we seek to adjust the designs and structure of the web services according to your comments and client's ideals. Always trying to make sure that the final product meets all your expectations and needs.
